

## IntelliClimate™ ... the Smart Climate Controller

With PC software and an Internet connection, you can remotely access your grow room from anywhere. Check and adjust your temperature, humidity, CO2, lights and much more! This is especially handy for multiple grow rooms. Using the “advanced settings” page, dial your room into the exact conditions you desire, or use the factory presets for intelligent recommendations based on many years of experience.

### **Optimize plant performance by dialing in your growing environment.**

- Minimizes crop loss by knowing exactly what environment your plants require and giving it to them ... automatically ... all the time.
- Provides remote access to watch over how well your “helpers” are taking care of your crop. If something is wrong, you can correct it immediately.
- Provides PC data log to “dial in” what works and what doesn’t so in the future, you can anticipate variables and correct them before they happen.

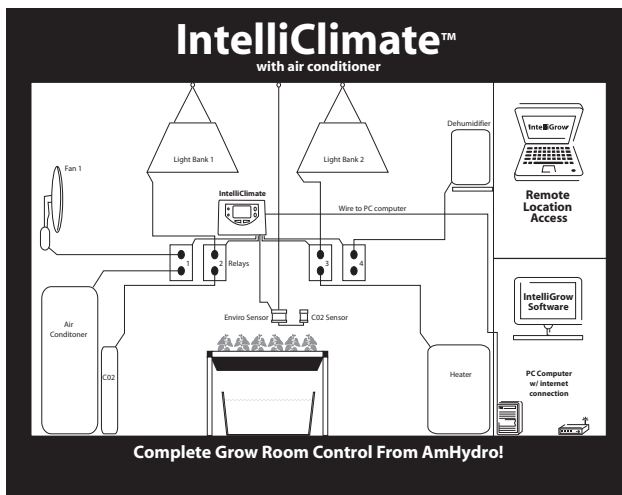

# IntelliClimate

## Automated climate control for optimum crop performance ...

All of the control gear (peripherals) in a grow room are only effective in relation to how well they “work together” for optimum crop performance.

### The problems with current methods of climate control are:

- There are no fail safe settings. If one peripheral stops working, the other components will continue to function to the detriment of the crop.
- Inaccurate climactic conditions lead to stressed plants, longer harvest times and pest/fungus infestations.
- Crop loss is common when peripherals are not ‘talking’.

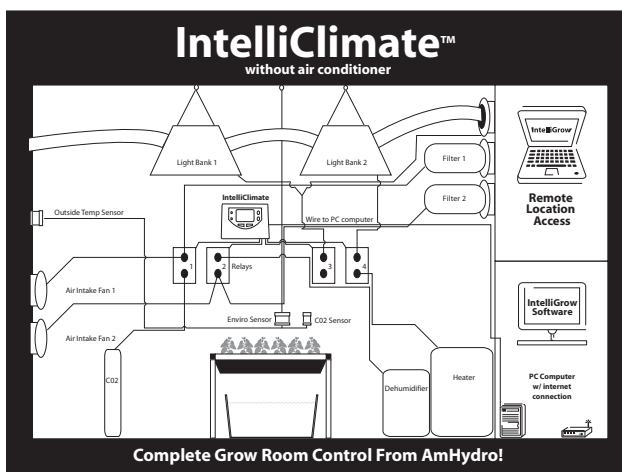

### Growers who are using the IntelliClimate report:

- Increased speed of growth, quality and yield with less labor
- Unprecedented communication between all climate control peripherals
- Able to control multiple grow rooms from a remote PC
- More time to focus on marketing and fun

### How the IntelliClimate works:

- Plug in all of your climate control peripherals and program your set points (temp, humidity, CO2, lights).
- Using your PC, schedule out the entire crop cycle, data log all aspects of your climate and remote access your room.

The IntelliClimate can run many different peripherals (fans, air conditioners, CO2 monitoring and injecting, heaters, dehumidifiers, humidifiers, pulsed foggers, multiple light banks, intruder alarms, etc.). You choose what you need for your room, the IntelliClimate will control it to your exact specifications.
